

Area of use

CM 700 is a pumpable, self-levelling underlayment. The CM 700 is suitable for new construction and renovation. The product is intended for indoor use on substrates of concrete, lightweight concrete, stone and ceramic tiles. The product can be delivered with the addition of fibrers.

Pre-treatment

The substrate should be clean and free of dust, cement skin, grease and other impurities that can prevent adhesion. Adhesion and surface strength of the substrate should be no less than 0.5 MPa. Always prime the underlying substrate with PP 600 and allow to dry before pouring. In terms of the primer forming a film, the temperature of the substrate must not fall below 10 °C. For best results, the ambient temperature in the work area should be between 10 and 25 °C. At higher or lower temperatures, the time for curing will shorten or extend. With the risk for cracks due to shrinkage or settings in the subfloor, a concrete surface should not be leveled within the first 28 days after casting. As a recommendation the RH in the concrete should have reached RH 90 % as the upper limit for pouring the CM 700. Use the Combimix form foam for edging. In order to avoid drainage pipes from getting clogged, always make sure the drains are properly sealed before pouring.

Mixing

Mix the dry powder with max 3,6 liters of water (max 18 %) per 20 kg bag for application thickness 5–40 mm and with max 3,2 liters of water (max 16 %) per 20 kg bag for application thickness 40–100 mm. Mix with a drilling machine and a whisk, or a mixing pump intended for this purpose. The correct water mixture can be tested using a slump test with a cylinder with Ø 30 mm and a height of 50 mm on 300 x 300 mm plexiglas plate. With the correct water mixture, the spread should be max 135 mm for application thickness 5–40 mm and max 125 mm for application thickness 40–100 mm. The slump test also checks that the material is well blended and that there is no separation.

Application

The mixed material is applied by hand, or pumped out onto the substrate in lengths. Each new ribbon is added to the old one as soon as possible so that the material can blend together and create an even surface. The width of the ribbons can be adjusted to the capacity of the mixing pump and the thickness of the covering. The material requires a light treatment with a toothed trowel to provide maximum smoothness.

Post-treatment and curing

You can easily shape or cut the semi-hardened self-leveling underlayment material before it fully dries. Always make sure that the material is sufficiently dry before it will be covered by a carpet or a foilsystem. The guided time for dehydration down to RH 85 % of the product is 10 mm per week. The guiding value assumes a curing temperature of approximately 20 °C, 40 % RH and proper air flow. Newly produced surfaces must be protected against wind, sun and rain. If the surface is to be left exposed without a floor covering for an extended period (two weeks), it must be primed with Primer PP 600 (diluted 1:5) no later than the day after leveling.

Storage time and packaging

Store in a dry environment on an unopened plastic-coated pallet. Paper packaging: Shelf life 6 months in unopened original packaging from date of manufacture. Plastic packaging: Shelf life 9 months in unopened original packaging from date of manufacture. The date of production is printed on the packaging. The product is delivered in bags of 20 kg, in big bags and in bulk.

Residual products and safety information

Paper packaging: Empty sacks are left for incineration. Plastic packaging: Empty bags are returned for recycling. Any remaining, dry powder that has been stored properly can be used again. Hardened material should be disposed of as construction waste. Do not wash the product into the sewage system. The cement in the product has a reduced level of chromate. Follow regulations in each respective country.

Health, environment, safety and technical service documents

Technical data as per EN 13813

Release of corrosive substances	CT
Compressive strength class	C20
Compressive strength average	30 MPa
Flexural strength class	F5
Flexural strength average	6 MPa
Fire resistance class	A1 _i
RWFC	550
Adhesion to surface	B1,0

Other properties

Substrate	Concrete, lightweight concrete, stone and ceramic tiles
Thickness	5–100 mm 6–20 mm on lightweight concrete
Grain size	< 2 mm
Material consumption	1,7 kg/m ² /mm
Weight (dry state)	1700 kg/m ³
Flow rate 5–40 mm 40–100 mm	max 135 mm max 125 mm
Working time	10–25 min
Final set	1–3 hrs
Coverable (tiles)	12 hrs
Carpetable	10 mm/week
pH	apx. 11
Water damage resistant	yes
Surface Tensile Bond Strength, 28 days (sanded surface)	1,0 MPa
Shrinkage	0,03–0,05 %
TVOC 28 days	39 µg/(m ² h)
